??

<think> The user is asking me to write a weekly review for a quantitative stock selection agent. However, all the data provided is empty/zero: - ????: 0 - ???: 0% - ?? PnL: 0% - ??????: {} - ??????: {} - ??????: [] - ??????: []

There is literally no data to analyze. I should be honest about this rather than fabricating insights. The user explicitly said "??????" (no other nonsense), so I should be direct.

I need to think about whether I should: 1. Point out the data is empty and can't generate meaningful analysis 2. Just output the requested format with appropriate "no data" content

Given the instruction "??????", I think the best approach is to briefly note that there's no data to analyze, while still respecting the format. But the format is strict. Let me think...

Actually, the most honest and useful response is to tell the user that with zero samples and all empty fields, there's no meaningful analysis possible. Making up insights from empty data would be the opposite of what a quant agent should do.

Let me write this concisely. </think> ?????????????????????????????
